

Traffic Flow Plates - Surface Mount Type (surface mount - bolt down fixing)

Traffic flow plates provide a simple way to prevent unauthorised entry to restricted areas and encourage a one way traffic flow.

These robust surface mount type plates feature rubber noise suppression bumpers, so they won't keep the neighbours awake at night and as replaceable components are available your investment is protected.

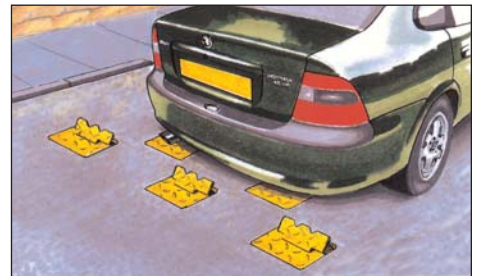

The standard surface mount flow plates are designed to prevent cars, small vans, etc. travelling in the wrong direction and are suitable for general use. The special HGV model is designed to provide an effective deterrent for larger vehicles, HGVs, etc, however the extra height of the restrictor flap could damage the underside of smaller vehicles travelling over them and they cannot therefore be installed in areas used by cars.

Ideal for use at car parks, site entry and exits, making roads one way to deter use as a rat run, etc.

- Economical
- Quick and easy to install
- Low maintenance
- Replaceable components
- Choice of Standard or HGV models

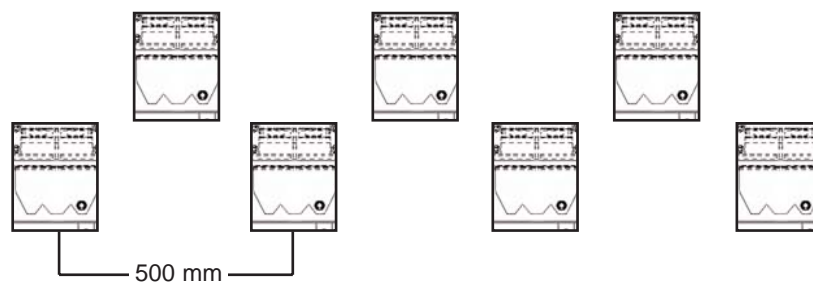

Surface mount traffic flow plates, are available in standard and HGV models. All units feature multi-point fixing and rubber noise suppression bumpers

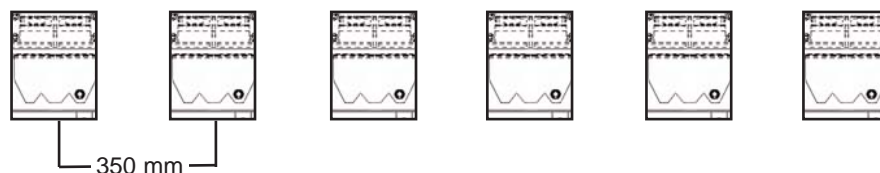

Flowplates can be installed as a single row across the roadway, or for maximum effect, as a staggered double row

Installation Layout Guide: for a double row installation

Installation Layout Guide: for a single row installation

Note: speed restrictor bumps can be used to slow vehicle approach to the plates and warning signs can be used to alert drivers their presence.
