

28 SMOKE PROTECTION PRODUCTS

Protecting the office / warehouse

Smoke systems work on the concept that if you can't see it, you can't steal it. Although 'smoke' is a term in common use for this type of product, it is really a misnomer as visibility is impaired by something more akin to fog.

Such systems work by rapidly heating an alcohol based fluid (such as a glycol mixture) to a gaseous state which instantly condenses on contact with air in the room thus forming a dense fog which can reduce visibility within a room to just a few inches in a matter of seconds.

The smoke is non toxic and when properly installed does not leave a residue after activation.

It is non harmful to people or sensitive electronic equipment (PCs, etc.) making it an ideal solution for protecting offices, warehouses, equipment stores or jewellers.

Smoke systems must be professionally installed and it is essential that key emergency services such as Police and Fire Brigade are advised of the installation of such systems, as well as the alarm company responsible for the building.

We would be pleased to discuss your requirements and arrange a no obligation survey of your premises should you feel this type of system would be suitable for your environment.

the office – five seconds after triggering

the same view just two seconds later

Protecting cash & valuables

Smoke and / or dye systems are in widespread use for protecting cash in transit. Such systems are designed to permanently stain notes thus rendering them unusable and therefore valueless to the thief.

They remove the need for persons carrying the cash to defend it against any would be thief, thus increasing the personal safety of personnel.

We would be pleased to discuss your requirements for this specialist range of products and to advise on the most appropriate product or solution for you.
